

## ABSTRACT

A modular system of power and data components comprising a substation having power and data ports is provided. The system includes channels releasably connectable to the substation and supports. The substation, channels and supports are releasably and rotatably connected to permit the system to be formed in almost infinite combinations to accommodate numerous office or work space configurations. The system is used in conjunction with tables, screens and other furniture to form a fully and easily adjustable office or work space set-up to accommodate any office or work space situation and to allow quick change to accommodate changes in the initial office or work space set-up.
